

The 100× suppression is an ASSUMED placeholder — not derived, and deliberately NOT transferred from NUCLEUS, whose ~5 and ~50 are event-rate reductions in CaWO₄ that embed a target response which is not Ge's.
Faint dotted = untriggered; the gap is the trigger-efficiency rolloff at the NEW $E_{50} = 1.0$ eV (deposit). Saturation was always in R, not added here.
